

PROBLEM STATEMENT

AI Across the Product Development Lifecycle (Tracewise AI)

PROBLEM

The product-development lifecycle — requirements, design, build, test, release — carries manual handoffs, scattered documentation, and inconsistent traceability. This slows velocity, allows requirement-to-test gaps, and makes status hard to see.

SOLUTION

Build a set of PDLC agents that draft and refine requirements, generate test cases from requirements, maintain requirement-to-test traceability, summarize design reviews, and surface gaps and status. The agents ground outputs in project artifacts (RAG) and explain coverage, accelerating velocity while improving traceability.

EXPECTED OUTCOME

A prototype that takes a requirement set, generates test cases with traceability, flags coverage gaps, and produces a status/coverage summary.
